

Continuous Compliance Simplified

McAfee® Configuration Control centralizes and automates compliance monitoring and reporting in large, complex environments

Regulatory mandates are expanding and proliferating faster than organizations can ramp up to meet their requirements. Deploying one point product for SOX compliance, another for PCI, and another still for HIPAA is a recipe for integration nightmares, manual workarounds, failed audits, and serious risks of punitive financial penalties. The costs and risks of piecemeal compliance are ultimately unacceptable and unsustainable. Organizations need a comprehensive solution that is tightly integrated, highly automated, extensible, scalable, and reliable.

Key Points

McAfee Configuration Control provides:

- Centralized policy auditing and reporting
- End-to-end change control and configuration integrity
- Single-console management through tight integration with McAfee ePolicy Orchestrator® (McAfee ePO™) software
- Fast, convenient extensibility for risk management, endpoint and network security, host intrusion prevention, application control, and vulnerability management

McAfee Configuration Control combines the advanced capabilities of McAfee Policy Auditor and McAfee Change Control to put you in command of your compliance requirements and keep you there. It automates data collection, benchmark-mapping, change-tracking, and reporting for any internal or external audits with proactive controls that keep you in seamless compliance.

McAfee Policy Auditor: A Single Solution for Multiple-Mandate Policy Management

McAfee Policy Auditor is a complete configuration management product that delivers simple, centralized policy definition and automated compliance auditing across multiplatform environments, including Microsoft Windows, Unix, and Linux systems. Easily create configuration policies from scratch, or select, clone, and customize policies from an extensive library of predefined rules. Included rule sets address key security standards (CIS, DISA, FDCC) and industry regulations (PCI, GLBA, SOX, HIPAA, COBIT, ISO). Audit scans automatically compare actual and defined configuration states, displaying the results on mandate-specific dashboards. Now you can review critical configuration events and compliance state data at a glance.

McAfee Change Control: Automated, End-to-End Enforcement

McAfee Change Control provides end-to-end policy enforcement that puts teeth in your policies and locks down configuration settings throughout your environment. File integrity monitoring tracks all changes to files, directories, and registry keys, providing visibility and real-time alerting to quickly resolve incidents and increase uptime. Change prevention capabilities based on read-and-write protection prevents out-of-policy changes and logs all attempts. Finally, McAfee Change Reconciliation maps all tracked changes to their originating requests in Remedy and other change management applications, effectively closing the loop on all change processes.

Unified Management of Endpoint, Network, and Data Security

Tight integration with the McAfee ePolicy Orchestrator (McAfee ePO) platform provides end-to-end visibility and powerful automations that slash incident response times. In addition, the McAfee ePO platform dramatically strengthens protection and drives down the cost and complexity of managing risk, security, and compliance.

Automate Your Compliance Assessment

With multiple-mandate compliance audits and end-to-end change control, McAfee Configuration Control lets you automate much of your compliance assessment, monitoring, and reporting. System-level controls give you flexible assessment capabilities, with your choice of on-demand or scheduled reporting.

Get Regulation-Specific Remediation Guidance

By combining graphical reporting of actual configuration status with built-in benchmarks for key regulations, McAfee Configuration Control delivers everything you need to quickly and accurately assess your compliance posture under multiple regulatory mandates, identify gaps, expedite remediation, and document the results.

Realize Continuous Compliance

End-to-end visibility and control helps you enforce centralized configuration management across servers and endpoints enterprise-wide. McAfee Configuration Control denies all unauthorized changes from targeted malware, user installations, and unintended changes that might jeopardize compliance or enterprise standards.

An Integrated and Extensible Compliance Solution

Eliminate labor-intensive, error-prone integration of separate point products from multiple vendors for different platforms. Compliance is automatically integrated across all servers, endpoints, and networks, giving you real-time visibility into all your risk and compliance measures.

Want to extend the capabilities of McAfee Configuration Control? Tight integration with other McAfee security and management products lets you easily automate risk management, endpoint and network security, host intrusion prevention, application control, and vulnerability management.

A Simpler Solution for Continuous Compliance Assurance

McAfee Configuration Control dramatically reduces the cost and complexity of regulatory compliance. It automates and centralizes policy management, compliance auditing, and change control across the largest environments. This customizable continuous compliance solution eliminates manual processes and point product integration, delivering single-console management and end-to-end visibility of requirements and compliance status under most major mandates.
