

McAfee VirusScreen ASaP

Managed Email Virus Screening

Scan and Clean Virus-Infected Messages Before They Enter Your Network

Increased use of the Internet has resulted in an exponential growth in the number of viruses detected annually. Today, nearly 87% of all viruses are spread via email. To counter this threat, VirusScreen™ ASaP moves at the speed of the Internet, scanning and cleaning emails before they reach your gateway, providing automatic and immediate virus updates round-the-clock.

Developed from proven McAfee® anti-virus technology using McAfee's award-winning virus scanning engine, VirusScreen ASaP provides the best possible detection and cleaning in the marketplace. VirusScreen ASaP is a managed scanning service that addresses one of the most serious security issues affecting the enterprise today—virus infected email. With your subscription, VirusScreen ASaP scans all email before it reaches your gateway. Thus, email-borne viruses are prevented from penetrating the network. VirusScreen ASaP also scans outgoing mail to prevent your employees from transmitting infected messages.

Completely Managed—Set-and-Forget Email Security

Email-borne viruses are responsible for several important networking issues, including: data deletion, bandwidth congestion, and service infrastructure downtime. System downtime associated with resolving a virus outbreak can be quite significant. Without VirusScreen ASaP's immediate updates, system administrators must detect viruses and search for solutions manually—an unnecessarily slow process when response-time is critical. Now, within minutes, you can have an anti-virus solution to completely prevent malicious email from entering your network. And unlike gateway or groupware-based virus scanners, which perform back-end scanning at a single location in your network, VirusScreen ASaP requires no hardware, software, maintenance, or technical expertise. By signing up for VirusScreen ASaP, email will be instantly scanned before it arrives on your mail server, virus-free. VirusScreen ASaP will quarantine any infected files in a secure area where only your administrators can access them—ensuring 100% privacy and protection.

Key Features

Anti-Virus Protection at Your Network Perimeter

- Screens SMTP email before it enters your network, providing 100% virus detection and cleaning
- Offers the most comprehensive and updated virus DAT file in the marketplace—our systems are updated 24x7
- Backed by McAfee AVERT—the world's leading virus detection and research institute

Internet-Based

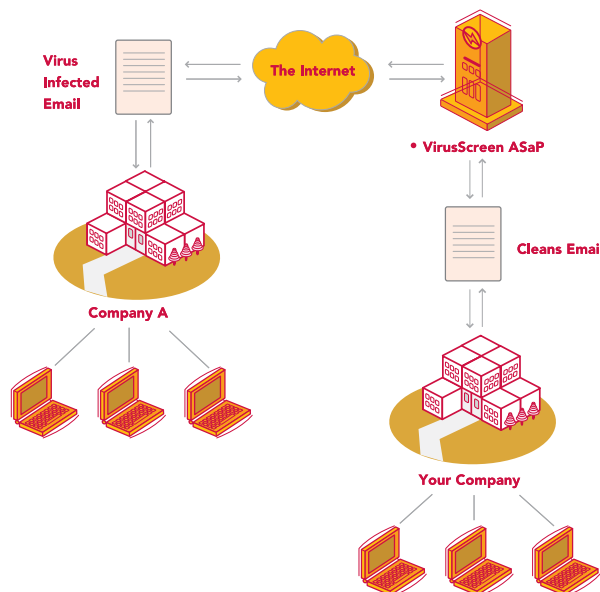

- Allows for quick and easy enrollment
- Uses Web-based deployment, management, monitoring, and configuration—no need to buy, support, or update equipment or software

Web-Based Reports

- Presents detailed management reports that feature a variety of information, from overall screening statistics to actual quarantined email

Carrier-Grade Infrastructure

- No email latency issues

McAfee VirusScreen ASaP

Managed Email Virus Screening

How VirusScreen ASaP Works

VirusScreen ASaP acts as a filter between the Internet and your network. Your existing mail system has a domain name server (DNS), which has an MX record that maps your email address to your mail server. Typically, the MX record is configured to direct mail to your server. By redirecting your MX record to point to the VirusScreen ASaP scanners, all external mail will flow through the service—where it is screened for viruses and then directed to your email server, cleaned and safe.

Comprehensive, Web-Based Reporting

VirusScreen ASaP surpasses traditional file logs with high-level and detailed performance reports that can be viewed and downloaded from your secure area on the Web site—24 hours a day. With VirusScreen ASaP, you can view a variety of reports, ranging from overall screening statistics to actual email that has been caught and quarantined for administrator review. Your reports are kept on our servers, allowing you to access up-to-the-hour details on-the-fly. No waiting and no filtering through lengthy log files and generating reports. All the information you need is clearly displayed and interpreted in the easy-to-understand Web-based reports.

Centralized Management and Monitoring

VirusScreen ASaP saves your company from the costs and operational issues associated with implementing a robust email virus screening solution. From your initial registration, VirusScreen ASaP provides you with 24x7 centralized management and monitoring of your email traffic. With instant updates as soon as new viruses are identified anywhere in the world, VirusScreen ASaP provides you with constant protection from infected messages.

VirusScreen ASaP is part of a range of McAfee Security managed AV solutions, including VirusScan® ASaP—the world's first self-updating desktop anti-virus solution. VirusScreen ASaP is also backed by McAfee AVERT (Anti-Virus Emergency Response Team), the market's leading anti-virus research organization. With offices on five continents and over 65 researchers employed worldwide, McAfee AVERT identifies more viruses and provides the latest cures faster than from any other vendor.

All Network Associates products are backed by our PrimeSupport® program and Network Associates Laboratories. Tailored to fit your company's needs, PrimeSupport service offers essential product knowledge and rapid, reliable technical solutions to keep you up and running. Network Associates Laboratories, a world leader in information systems and security, is your guarantee of the ongoing development and refinement of all our technologies.
