

Threats Predictions

McAfee Labs

Cyber Espionage

Cyber espionage attacks will continue to increase in frequency.

Gather Intelligence

Long-term players will become stealthier information gatherers.

Sophisticated cybercriminals will shift from quick attacks to intelligence gathering.

Steal Money

Newcomers will look for ways to steal money and disrupt their adversaries.

In 2013, there were 511 total cyber espionage incidents, including 306 with confirmed data disclosure.¹

Types of cyber espionage actors.²

Internet of Things

Attacks on Internet of Things devices will increase rapidly due to hypergrowth in the number of connected objects, poor security hygiene, and the high value of data on IoT devices.

50 Billion Devices

Over 50 billion global Internet-connected devices by 2019.³

IoT Devices

Attacks against IoT devices are already commonplace.

- IP cameras.
- smart meters.
- healthcare devices.
- SCADA devices.

A recent study by HP found alarming security statistics in the IoT space. Of 10 popular devices tested:⁴

Privacy

Data privacy will remain under threat as governments and businesses grapple with what is fair and authorized access to personal information.

110 Million People

About 110 million Americans—equivalent to about 50% of US adults—have had their personal data exposed in some form in the past year.⁵

Passwords

Antiquated role-based systems and password schemas will fail and be taken over by those with malicious intent.

Regulations

There will be an ever-increasing creep in the scope of data privacy rules and regulations.

Biometrics

Biometrics and IDs in context will be key areas for innovation and likely the best indicators of presence and intent.

Ransomware

Ransomware will evolve its methods of propagation, encryption, and targets.

2 Million Samples

The total number of ransomware samples in the McAfee Labs zoo surpassed 2 million in Q3 2014.

Cloud-based Storage

Ransomware will target endpoints that subscribe to cloud-based storage services, attempting to exploit the stored credentials of logged-on users to also infect data backed up to the cloud.

\$255,000 Stolen

McAfee Labs observed the theft of \$255,000 in a single month in one CryptoLocker ransomware instance.

Mobile Space

We expect the technique of ransomware targeting data backed up to the cloud to be repeated in the mobile space.

Mobile

Mobile attacks will continue to grow rapidly as new technologies expand the attack surface and app store abuse goes unchecked.

Digital Payments

The adoption of near-field communication (NFC) for digital payments from mobile devices will attract cyberthieves.

Virtual Currency

We expect a rise in ransomware targeting mobile devices using virtual currency as the ransom payment method.

Malvertising

Untrusted app stores will be a major source of mobile malware, driven by "malvertising."

Mobile Malware Kits

The growing availability of malware-generation kits and source code will make it easier for cybercriminals to target mobile devices.

Mobile malware samples grew by 16% this quarter and 112% in the past year.

The total number of mobile malware samples exceeded 5 million in Q3 2014.

Malware Beyond Windows

The Shellshock vulnerability will fuel non-Windows malware attacks that will continue for years.

22,487 Attacking IP Addresses

In the first four days after announcement, Shellshock-related attacking IP addresses totaled 22,487.⁶

Shellshock

Attackers will capitalize on Shellshock by exfiltrating data, holding systems ransom, and assimilating spam bots.

Devices

Devices, such as routers, TVs, industrial controllers, flight systems, and critical infrastructure could contain this vulnerability.

Dangerous

Shellshock is rated 10 out of 10 for severity by the National Vulnerability Database.⁷
