McAfee Endpoint Threat Protection

Essential, effective protection that grows with your business

There is no doubt that the threat landscape will continue to evolve. You already know that mounting a strong defense begins at the endpoint. However, it can be difficult to get the protection you need today without the ability to add new technologies over time that will ultimately create complex, siloed security operations. McAfee® Endpoint Threat Protection offers the essential protection you need today and keeps you ready for tomorrow’s advanced threat defense requirements. It delivers integrated threat prevention, firewall, web, email, and device control defenses that work together in real time to analyze and collaborate against threats, blocking and quickly remediating them before they impact your systems or users.

A Collaborative Endpoint Framework
Built with integration in mind, McAfee Endpoint Threat Protection defenses collaborate and share what they see in real time to coordinate identification and block the execution of suspicious files, websites, and potentially unwanted programs for a higher level of protection.

Use Case
Download of a malicious file from the web

A file hash is sent from McAfee Web Control to McAfee Threat Prevention, triggering an ODS. Malicious files are detected and blocked before they have full access to the system.
Forensics data is captured (source URL, file hash, and other information).
Event data is shared with other modules and McAfee® ePolicy Orchestrator® (McAfee ePO™) software and is visible in client user interface.

Figure 1. How McAfee Endpoint Threat Protection defenses work together.
An Integrated Solution for Today and Tomorrow

With McAfee Endpoint Threat Protection, you can replace disconnected point product deployments with a connected, collaborative framework and near real-time protection across multiple protection technologies. This not only allows for stronger analysis of threats, it also enables the threat forensic data that is gathered to be shared with other defenses to make them more intelligent and help them more quickly identify and block threats on other endpoints or when encountered by a different entry point.

Deployment is also flexible, thanks to this approach. You can install everything that comes with your purchase today and decide what functionality will be configured and active now. You can easily activate the capabilities you decide to use later with a policy change.

Lastly, our framework lets you easily expand your protection as your needs change, thanks to an architecture designed to include additional technologies. This ensures that you are ready at any time to introduce other advanced protection capabilities to defend against more sophisticated threats.

Affordable Without Sacrificing on Performance

McAfee Endpoint Threat Protection offers an expandable framework with core protection technologies without introducing complexity or sacrificing performance, delivering increased productivity for you and your users. For example, your operations will run more efficiently due to centralized management via McAfee ePolicy Orchestrator software, which offers a single pane of glass to deploy, monitor, and manage security policies across your environment. Customers with multiple operating systems in their environment will be able to increase their productivity using cross-platform policies for Microsoft Windows, Apple Macintosh, and Linux systems. And, because a common language (McAfee Data Exchange Layer) is used by the components of McAfee Endpoint Threat Protection, you can optimize processes between technologies and speed responses to threats, reducing risks by narrowing the window of exposure.

Your users will also get increased productivity with zero-impact user scans, memory, and CPU use, which are optimized to minimize the impact to systems. An intuitive user interface also comes standard and makes it easy for you and your users to get quick insights into which actions have been taken and why.

Figure 2. The intuitive user interface keeps things simple for administrators and users
**Component** | **Advantage** | **Customer Benefits** | **Differentiation**
--- | --- | --- | ---
Threat Prevention | Comprehensive protection that finds, freezes, and fixes malware fast with multiple layers of protection. | • Stops known and unknown malware using heuristics and on-access scanning techniques.  
• Simplifies policies and deployments with protection across Windows, Macs, and Linux platforms.  
• Boosts performance by avoiding scans on trusted processes and prioritizing those appearing suspicious. | Multilayered anti-malware that collaborates with and informs web and firewall defenses for stronger analysis and to intelligently apply rules to block potential threats.  

Integrated Firewall | Protects endpoints from botnets, distributed denial-of-service (DDoS) attacks, untrusted executables, advanced persistent threats, and risky web connections. | • Protects users and productivity by enforcing your policies.  
• Guards bandwidth by blocking unwanted inbound connections and controlling outbound requests.  
• Equip users by informing them of trusted networks and executables and risky files or connections. | Application and location policies safeguard laptops and desktops, especially when they are not on the corporate network.  

Web Control | Ensure safe web browsing with web protection and filtering for endpoints. | • Reduces risk and guards compliance by warning users before they visit malicious sites.  
• Prevents threats and protects productivity by authorizing or blocking dangerous or inappropriate websites.  
• Stops dangerous downloads safely by blocking them before they can be downloaded. | Protection across Windows, Mac, Linux, and multiple browsers, informed by McAfee Global Threat Intelligence.  

McAfee Data Exchange Layer | Connects security to integrate and streamline communication with both Intel Security and other third-party products. | • Integration reduces risk and response time.  
• Lower overhead and operational staff costs.  
• Optimized processes and practical recommendations.  
• Shares the most important threat information between security products.  
• Instantly shares patient zero threat insight with all other endpoints to prevent infections and update protection. |  

McAfee ePO Management | A single pane of glass for highly scalable, flexible, and automated management of security policies to identify and respond to security issues. | • Unify and simplify security workflows for proven efficiencies.  
• Greater visibility and flexibility to take action with confidence.  
• Quickly deploy and manage a single agent with customizable policy enforcement.  
• Shorten the time from insight to response with dynamic and automated queries, dashboards, and responses.  
• Greater control, lower costs, and quicker operational security management with a single console.  
• A proven interface that has been widely recognized throughout the industry as superior.  
• Drag-and-drop dashboards across a vast security ecosystem.  
• Open platform facilitates rapid adoption for security innovations. |
